

The implementation of transportation with patent

The patent system of taxation was introduced in Russia in 2013. This system has not gained much popularity among businessmen that it is not deserved. She has a number of disadvantages especially for the cost but in road transport the patent for the transportation of goods is the optimal solution for the entrepreneur. According to the tax code by purchasing this certificate SP is exempt from the greater part of the fees. In particular There are different opinions on the issue of financial benefit in the purchase of a patent but for entrepreneurs whose activity is connected with motor freight transportation benefits of working with such evidence. The calculation here is simple trader has 15 trucks more in this form of taxation will not be able to recoup costs associated with paying of this document will be very easy. Why Consider below. To work with PSN citizen, you must register as an individual entrepreneur. After registration and obtaining a certificate of incorporation it is required to apply the model of which he can take on the official website of the tax service. The document will be valid until 31 December to make it for a month or more. If the PI will arrange the tax system this document, it should be purchased each year. The application for a patent, the entrepreneur can be submitted simultaneously with application for registration as IP. The conditions for obtaining this document apply in the case if the SP income for the calendar year exceeded \$ 1 147 000 and gross revenues of 60 million. The entrepreneur can work no more than 15 people and therefore a greater number of working machines to keep does not make sense. Thus the question arises if FE freight on two cars how many patents does he need to make Enough to issue one document for several cars. The number of cars doesn't matter if they work on one type of activity and contract for road transportation of cargo with the owner of the PI enclosed in the region where the address was and where he acquired the patent. Let's consider such situation the entrepreneur in the presence of a truck tractor Scania and let the refrigerator of the class S. One can buy two cars if both of them will cooperate with one consumer. Example of a major grocery chain enters into a contract with PI for the transport of food two machines. The agreement must be made in the area where a patent was issued for transportation of IP. Or the owner of machinery may enter into contracts with different customers, but again, they must be from the same region. The cost of registration is determined by each region independently.
